DEPARTMENT OF COMPUTER SCIENCE AND ENGINEERING

Name of Title: **Integrated Multi-Vendor Marketplace, Analytics & B2B Ordering System**

1. Abstract:

This project features an integrated e-commerce ecosystem which will allow the creation of a multi-vendor marketplace with an admin panel, seller analytics dashboard, and B2B wholesale ordering portal all on one scalable platform. This solution is designed to assist administrators in improving operations, provide sellers with data-driven insights, and increase business clients' ease of purchasing in bulk — addressing the varying needs of today's online retailing market.

The multi-vendor admin panel allows the efficient management of sellers including managing seller accounts, approving products, creating a commission structure, managing disputes, and monitoring the entire platform. The use of the multi-vendor admin panel will establish good governance and transparency across the entire marketplace.

The seller analytics dashboard provides sellers with actionable intelligence including data from the seller's sales, conversions, returns, customer demographics and top-performing items. The seller analytics dashboard also includes features that enable sellers to filter and visualize their analytics which will facilitate good decision-making by the seller, allowing them to optimize their own performance.

The B2B wholesale ordering portal enhances the e-commerce ecosystem by providing vendors with all tools necessary for bulk transactions: minimum order quantity (MOQ) displays, tiered pricing structures, credit limit management, the ability to upload purchase orders and handle invoices. The B2B wholesale ordering portal supports seamless procurement for business clients, facilitates scalable transactions, and automates the bulk procurement process.

The new e-commerce system is built upon modern web-based technologies including HTML5, CSS3, JavaScript (ES6+), React, Node.js and Express.js. The e-commerce system will also support RESTful APIs
